EASY ON YOUR SOLE

Unlike other "cushion" systems, Ultracushion does not use ground up tires or buffings to soften the impact of playing. Ultracushion gets its superior shock absorbing ability from a special elastic acrylic binder and new EPDM rubber crumb and granules. Because of the shape and size of the rubber, you will not have rubber particles sticking up through the playing surface.

The basic Ultracushion surface consists of several layers of Ultracushion followed by layers of Novacushion and Novacrylic Combination Surface. The degree of shock absorbency can be increased by the addition of more Ultracushion layers. The owner can customize the Ultracushion surface to suit both the desired content and budget.

Ultracushion is perfect for both indoor and outdoor installations.

Ultracushion is low maintenance.

Ultracushion is non-fading.

Ultracushion provides the same low abrasion, non-sticky, high-performance surface as all of the Novacrylic surface systems.

The comfort of playing tennis on an Ultracushion court is especially appreciated by older tennis players and those who spend a lot of time playing. It is valued by teaching pros because of the reduction of fatigue.

Ultracushion, as all of the other Novacrylic materials, is non-hazardous and is free of lead, mercury, asbestos and formaldehyde.
